

ABSTRACT

A program reception system comprises: a program selecting apparatus storing reception information, displaying program tables, and selecting a program according to signals
5 from the remote controller or transmitting selected program's reception information; a wirelessly communicable remote controller; and a receiving/recording apparatus. The remote controller includes a recording medium, a user-operation receiving unit, a selecting unit for transmitting signals to
10 select programs to the program selecting apparatus, a requesting unit for, upon a first operation, transmitting signals for requesting the selected-program's reception information to the program selecting apparatus, a receiving unit for receiving and recording, onto the recording medium, the reception
15 information, and a forwarding unit for, upon a second operation, transmitting the recorded reception information. With the second operation performed on the remote controller pointed toward the receiving/recording apparatus, the selected-program's reception information is transmitted to the
20 receiving/recording apparatus which, in response, receives and records the program.
